

Module 7 Free Response and Essay Tips

Below you will find a breakdown of different AP topics for this module. The sections include expectations for answering questions over each topic and examples of how these areas should be handled:

BASICS FOR T TESTS AND T CONFIDENCE INTERVALS

Actual AP Exam Expectations	Notes
T test and interval conditions	State if: Population standard deviation is unknown, SRS, normality, independence, Pop > 10n Create a boxplot and state the shape and if any outliers *If n<15 the data must give an approx. normal distribution with little skewness and outliers. PROCEED WITH EXTREME CAUTION!
	*If 15 <n<40 <a="" a="" data="" distribution="" does="" extreme="" give="" have="" href="PROCEED WITH CAUTION!!" must="" not="" or="" outliers="" skewness.="" that="" the="">PROCEED WITH CAUTION!! *If n > 40, it is justified to use a t procedure because the CLT applies</n<40>

CONFIDENCE INTERVALS -- 1 sample and 2 sample and MARGIN OF ERROR

Actual AP Exam Expectations	Notes
1. SHOW all steps of the confidence interval	Notes 1) Parameter: 1 sample t interval "We want to estimate the mean, μ, of _context of problem" Matched pairs (1 sample t interval) "We want to estimate the mean difference of _context between sample 1 and sample 2 in context. 2 sample t interval "We want to estimate the mean difference between _population 1 and population 2 in context of problem " 2) Conditions ** For 2 sample T interval, you must check and state conditions for both populations** *Population standard deviation is unknown *SRS: If stated in problem, tell the grader, if not, then you should say: We are not told if SRS of all, so proceed with caution! *Normality = n<15, 15 <n<40, n="">40 SEE #3 ABOVE in condition section *Independence = Each observation is independent and population > 10n ie: if I have 100 calculators, we tell AP Grader, we can assume that each calculator is independent and there are more than 10(100) or 1000 calculators Name the interval: One sample t interval or 2 sample t interval</n<40,>

Module 7 Free Response and Essay Tips

	3) Show all work:
	If you use you the formula, you must do all work by hand and show the equation . If you use the calculator you must NAME the test/interval that you selected, ALL inputted information, and ALL output information If DATA is given, graph and describe
	 Interpret the results in the context of the problem and make a connection to the given information. Remember the 3 C's: Context, connections and conclusion.
2. Degrees of Freedom	1 sample t interval: Sample size – 1, which is n-1 2 sample t interval: find the degrees of freedom on your calculator when you compute the interval
	Conclusions should be given in terms of the context of the question. 1 sample t interval: We are% confident that the true population mean μ of context will be between _lower value and _upper value
Interpret the results of the confidence interval	Matched pairs (1 sample t interval): We are% confident that the mean of the population differences ofcontext is between lower value and upper value
	2 sample t interval: We are% confident that the true difference between the population mean μ_1 of context and the population mean μ_2 of context is between lower value and upper value
	1 sample T interval: $\bar{x} \pm critical\ value\ (\frac{s}{\sqrt{n}})$
4. T interval equations	Matched Pairs (1 sample T interval): $\overline{x_d} \pm \frac{s_d}{\sqrt{n}}$ *use the mean and standard deviation of the differences*
	2 sample T interval: $(\bar{x}_1 - \bar{x}_2) \pm t^* \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$
5. Margin of error	Everything after the +/- in the confidence interval This value shows how accurate we believe our guess is and is based on the variability of the estimate
6. Find the t* for the confidence interval	Using the calculator: Subtract the level of significance from 1. So $1-\alpha$ and then divide that value by 2. On the calculator DISTR-> INV T -> AREA: (($1-\alpha$)/2) df: n -1 -> ENTER This will give you the critical value t*

- The Margin of error decreases when: t* decreases, confidence level decreases, sample size (n) increases
- Increasing the sample size decreases the width of a confidence interval and the variability
- Use t when you are not given the population standard deviation.
- Use a one sample t interval when you have matched pairs one sample that is being analyzed at two
 different times, and we are analyzing the actual <u>difference</u> amount.
- Use a two sample t interval when you have **two different samples** that are being analyzed and compared to one another to see if they are different.
- When 0 is in the confidence interval, we can assume that there is no difference between the 2 means.
- Here is a video specific to this topic. It includes examples and how to be most successful on the AP exam
 for the topic.

7.01: Standard Error and T Intervals

https://sas.elluminate.com/site/external/jwsdetect/playback.jnlp?psid=2015-01-24.0743.M.02B50E368656D296A2DCBFED1F5B9E.vcr&sid=679

TESTS OF SIGNIFICANCE – One sample T test and 2 sample T test

	1) Parameter: same as confidence intervals
1. SHOW all steps of the test	 2) Conditions ** For 2 sample T test, you must check and state conditions for both populations** (see above interval #1 for specifics on each of these) * Population standard deviation is unknown *SRS *Normality *Independence Name the test: One sample t test or 2 sample t test State the null (Ho) and alternative hypotheses (Ha) in context. Note: H₀: null hypothesis is ALWAYS = to Hₐ: alternative is < > or ≠ 3) Show all work: same as for confidence intervals 4) Interpret the results in the context of the problem and make a connection to the given information. Remember the 3 C's

Module 7 Free Response and Essay Tips

Ho: The true population mean of $\frac{\text{context}}{\mu}$ is equal to $\frac{\text{context}}{\mu}$. l		

Interpret the results of a t test	Matched pairs t test: Reject or Fail to reject the null hypothesis that the mean differences of <u>sample 1 and sample 2</u> is equal to 0 because the p value is $> < \neq$ level of significance. There is/is not sufficient evidence to suggest that <u>restate the null hypothesis</u> .
	2 sample t test: Reject or Fail to reject the null hypothesis that the difference in the population mean of <u>population 1</u> and the population mean of <u>population 2</u> is equal to 0 because the p value is $> < \neq$ level of significance. There is/is not sufficient evidence to suggest that <u>restate the null hypothesis</u> .

- <u>P-value:</u> The probability of seeing a result from a random sample that is as extreme as or more extreme than the result you got from your random sample, if the null hypothesis is true.
- You can also find the p value, once you have the t score, by using 2nd -> Distr -> tcdf(lower, upper, df)
- Increasing the sample size decreases the p-value of the test (making the rejection of the null more convincing). As n increases, so does the power of the test.
- Use a two sample t test when you have two different samples that are being analyzed and compared to
 one another.
- Use a one sample t interval when you have matched pairs one sample that is being analyzed at two
 different times, and we are analyzing the actual <u>difference</u> amount.
- Here is a video specific to this topic. It includes examples and how to be most successful on the AP exam for the topic

7.02-7.06: Significance tests and Difference of Means

https://sas.elluminate.com/site/external/jwsdetect/playback.jnlp?psid=2015-01-24.0954.M.02B50E368656D296A2DCBFED1F5B9E.vcr&sid=679

Module 7 Free Response and Essay Tips

CONFIDENCE INTERVALS -- 1 and 2 proportions and MARGIN OF ERROR

Actual AP Exam Expectations	Notes
	Parameter: "We want to estimate the mean proportion, p, of <u>context of problem</u> "
	2) Conditions ** For 2 proportion intervals, you must check and state conditions for both populations** *SRS: If stated in problem, tell the grader, if not, then you should say: We are not told if SRS of all, so proceed with caution!
SHOW all steps of the confidence interval	*Normality – np > 5 and n(1-p)>5 If these are satisfied then we must say that we assume normality. *Independence – Each observation is independent and population > 10n
	Name the interval: One proportion or 2 proportion interval
	3) Show all work: same as t intervals
	 Interpret the results in the context of the problem and make a connection to the given information. Remember the 3 C's: Context, connections and conclusion.
Interpret the results of the confidence interval	Conclusions should be given in terms of the context of the question. 1 proportion interval: We are% confident that the true population proportion ofcontext will be between lower value and upper value
	2 proportion interval: We are% confident that the true difference between context and context is between <u>lower value</u> and <u>upper value</u> .
3. 1 proportion interval	$\widehat{p}\pmz^*\sqrt{rac{\widehat{p}(1-\widehat{p})}{n}}$
4. 2 proportion interval	$\hat{p}_1 - \hat{p}_2 \pm z^* \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$
5. Margin of error	Everything after the +/- in the confidence interval This value shows how accurate we believe our guess is and is based on the variability of the estimate
6. Equation to find sample size	$z^* \sqrt{\frac{\hat{p}(1-\hat{p})}{n}} \le m$ *You will be given m (margin of error)

- When 0 is in the confidence interval, we can assume that there is no difference between the 2 proportions.
- If p is or \hat{p} is not stated, we assume it is 0.5
- When estimating sample size, round up ALWAYS!
- $\hat{p} = \frac{\text{total number of successes in the sample}}{\text{total number of individuals in the sample}}$
- Here is a video specific to this topic. It includes examples and how to be most successful on the AP exam
 for the topic
- 7.08, 7.10, 7.11: Confidence Intervals and Proportions, Sample Size, and Margin of Error https://sas.elluminate.com/site/external/jwsdetect/playback.jnlp?psid=2015-01-24.1112.M.02B50E368656D296A2DCBFED1F5B9E.vcr&sid=679

TESTS OF SIGNIFICANCE -- 1 and 2 proportion Z test

Actual AP Exam Expectations	Notes
1. SHOW all steps of the test	 Parameter: same as confidence intervals for proportions Conditions ** For 2 proportion tests, you must check and state conditions for both populations** Same as confidence intervals for proportions *SRS *Normality *Independence Name the test: One proportion z test or 2 proportion z test State the null (Ho) and alternative hypotheses (Ha) in context. Note: H₀: null hypothesis is ALWAYS = to Hₐ: alternative is < > or ≠ Show all work: same as t test Interpret the results in the context of the problem and make a connection to the given information. Remember the 3 C's
2. 1 proportion z test	$\frac{\widehat{p}-p_0}{\sqrt{\frac{p_0(1-p_0)}{n}}}$

Module 7 Free Response and Essay Tips

3. 2 proportion z test	$\frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\hat{p}(1 - \hat{p})\frac{1}{n_1} + \frac{1}{n_2}}}$ $*\hat{p} = \frac{total \# of successes from both samples}{total number of individuals in both samples}$
	1 proportion z test: Ho: The true population proportion ofcontext_ is equal to $p = p_0 * \text{You must at least define what p is*}$ Ha: The true population proportion ofcontext is $<>\neq$ $p <>\neq p_0$
6. State hypotheses in context	2 proportion z test: Ho: The proportion of successes for <u>context population 1</u> is equal to the proportion of successes for <u>context population 2</u> . $p_1 - p_2 = 0 \qquad \text{or} \qquad p_1 = p$ *You must define what p_1 and p_2 are* Ha: The proportion of successes for <u>context population 1</u> is $< > \neq$ to the proportion of successes for <u>context population 2</u> . $p_1 - p_2 < > \neq 0 \qquad \text{or} \qquad p_1 < > \neq p_2$
4. Interpret the results of the test	Conclusions should be given in terms of the context of the question. 1 proportion z test: Reject or Fail to reject the null hypothesis that proportion of <u>context of the problem</u> is = to p_0 because the p-value is $< > \neq$ level of significance. There is/is not sufficient evidence to suggest that <u>restate the null hypothesis</u> .
	2 proportion z test:: Reject or Fail to reject the null hypothesis that the difference in the proportion of <u>context population 1 and context population 2</u> is equal because the p-value is < > ≠ level of significance. There is/is not sufficient evidence to suggest that restate the null hypothesis .

Errors: Type 1 error: rejecting Ho, when it is true
 Type 2 error: failing to reject Ho, when it is false
 If Ho is true, the probability of a Type 1 error = α
 The power of a test is the probability of correctly rejecting the Ho
